IN THE CLAIMS

Please amend the claims as indicated:

1	1.	(currently amended) A logging tool conveyed in a borehole for nuclear magnetic		
2		resonance (NMR) logging of an earth formation comprising:		
3		(a) a housing defining a longitudinal axis of the tool;		
4		(b) at least one sensor assembly coupled to the housing by an extension a		
5		coupling device, a body of said at least one sensor assembly adapted to		
6		make contact with capable of being close to a wall of a borehole in the		
7		earth formation, said sensor assembly including (A) a magnet for		
8		providing a static magnetic field in a sensitive region in said formation,		
9		(B) a transmitter coil for producing a pulsed radio frequency (RF)		
10		magnetic field in said sensitive region, and, (C) at least one receiver coil		
11		for receiving spin echo signals from nuclei in said sensitive region, said at		
12		least one receiver coil having an axis substantially parallel to an axis of		
13		said transmitter coil		
14		wherein an axial extent of the transmitter coil is greater than an axial extent of the		
15		at least one receiver coil		
16				
1	2.	(original) The logging tool of claim 1 wherein said at least one sensor assembly		
2		further comprises a plurality of sensor assemblies circumferentially distributed		
	584-25	584-25428-USC		

3		about said nousing.
4		
1	3.	(currently amended) The logging tool of claim 1 wherein said extension coupling
2		device is operated by one of (i) a spring, (ii) hydraulic power, and, (iii) electrical
3		power.
4		
1	4.	(original) The logging tool of claim 1 wherein said magnet is a U-shaped magnet
2		and further comprises:
3		(i) a first magnet and a second magnet having a magnetization direction
4		perpendicular to said longitudinal axis of the tool comprising arms of the
5		U, said first and second magnets having opposite directions of
6		magnetization, and
7		(ii) a magnetically permeable yoke forming the base of the U.
8		•
1	5.	(original) The logging tool of claim 1 wherein said RF magnetic field is produced
2		by activating the transmitter coil with one of (i) a CPMG sequence, and, (ii) a
3		modified CPMG sequence having a refocusing angle less than 180°.
4		
1	6.	(original) The logging tool of claim 1 wherein said RF magnetic field has a field
2		direction substantially orthogonal to said longitudinal axis and to a direction of the
3		static magnetic field in said sensitive volume.

4		
1	7.	(original) The logging tool of claim 1 wherein the at least one receiver coil further
2		comprises at least two receiver coils offset along the longitudinal axis.
3		·
1	8.	(original) The logging tool of claim 1 further comprising a field shifting
2		electromagnet including a coil for adjusting a position of the sensitive region.
3		
1	9.	(original) The logging tool of claim 1 wherein the at least one receiver coil is
2		displaced towards the borehole wall from the transmitter coil
3		
1	10.	canceled
2		
1	11.	(original) The logging tool of claim 4 wherein a gap between ends of the first and
2		second magnet away from the yoke is adjustable.
3		
1	12.	(currently amended) The logging tool of claim 1 further comprising a processor
2		for using the spin echo signals from the at least one receiver coil for determining a
3		parameter of interest of the earth formation.
4		
1	13.	(currently amended) The logging tool of claim 7 further comprising a processor
2		for using the spin echo signals from the at least two receiver coils for determining

3		a parameter of interest of the earth formation.		
4				
1	14.	(original) The logging tool of claim 12 wherein the parameter of interest is at least		
2		one of (i) clay bound water, and, (ii) bulk volume irreducible.		
3				
1	15.	(currently amended) A sensor assembly for nuclear magnetic resonance (NMR)		
2		measurements from a medium comprising:		
3		(a) a U-shaped magnet including a pair of magnets having opposed		
4		magnetization coupled by a permeable yoke for providing a static		
5		magnetic field in a sensitive region in the medium;		
6		(b) a transmitter coil for producing a pulsed radio frequency (RF) magnetic		
7		field in said sensitive region; and,		
8		(c) at least one receiver coil for receiving spin echo signals from nuclei in		
9		said sensitive region, said at least one receiver coil having an axis		
0		substantially parallel to an axis of said transmitter coil.		
1				
1	16.	(original) The sensor assembly of claim 15 wherein said RF magnetic field is		
2		produced by activating the transmitter coil with one of (i) a CPMG sequence, and,		
3		(ii) a modified CPMG sequence having a refocusing angle less than 180°.		
4				
1	17.	(original) The sensor assembly of claim 15 wherein the at least one receiver coil		
	584-25	4-25428-USC		

2		further comprises at least two spaced apart receiver coils
3		
1	18.	(original) The sensor assembly of claim 15 further comprising a field shifting
2		electromagnet including a coil for adjusting a position of the sensitive region.
3		
1	19.	(original) The sensor assembly of claim 15 wherein said transmitter coil is
2		positioned between the at least one receiver coil and the permeable yoke.
3	•	
1	20.	(original) The sensor assembly of claim 15 wherein a gap between ends of the
2		first and second magnet away from the yoke is adjustable.
3		·
1	21.	(currently amended) The sensor assembly of claim 15 further comprising a
2		processor for using the spin echo signals from the at least one receiver coil for
3		determining a parameter of interest of the earth formation.
4		
1	22.	(currently amended) The sensor assembly of claim 17 further comprising a
2		processor for using the spin echo signals from the at least two receiver coils for
3		determining a parameter of interest of the earth formation.
4		
1	23.	(currently amended)A method of determining a parameter of interest of an earth
2		formation comprising:
	584-25	428-USC

3		(a)	conveying a logging tool naving a longitudinal axis in a borehole in the
4			earth formation;
5		(b)	using a U-shaped magnet on at least one sensor assembly for producing a
6			static magnetic field in a sensitive region in said formation, said at least
7			one sensor assembly coupled to a housing of the logging tool by an
8			extension coupling device;
9		(b)	using a transmitter coil on the at least one sensor assembly for producing a
10			pulsed radio frequency (RF) magnetic field in said sensitive region; and,
11		(c)	using at least one receiver coil on the at least one sensor assembly for
12			receiving spin echo signals from nuclei in said sensitive region, said at
13			least one receiver coil having an axis substantially parallel to an axis of
14			said transmitter coil.
15			
1	24.	(origi	nal) The method of claim 23 wherein said at least one sensor assembly
2		furthe	er comprises a plurality of sensor assemblies circumferentially distributed
3		about	said housing; the method further comprising obtaining information about an
4		azimu	thal variation of said parameter of interest.
5			
1	25.	(curre	ently amended) The method of claim 23 further comprising operating the
2		extens	sion coupling device by one of (i) a spring, (ii) hydraulic power, and, (iii)
3		electr	ical nover

i	26.	(original) The method of claim 23 wherein said U-shaped magnet further				
2		compr	comprises:			
3		(i)	a first magnet and a second magnet having a magnetization direction			
4			perpendicular to said longitudinal axis of the tool comprising arms of the			
5			U, said first and second magnets having opposite directions of			
6			magnetization, and			
7		(ii)	a magnetically permeable yoke forming the base of the U.			
8						
1	27.	(origin	nal) The method of claim 23 wherein producing said pulsed RF magnetic			
2		field fi	urther comprises modulating a RF signal by one of (i) a CPMG sequence,			
3		and, (i	i) a modified CPMG sequence having a refocusing angle less than 180°.			
4						
1	28.	(origin	al) The method of claim 23 wherein said RF magnetic field has a field			
2		directi	on substantially orthogonal to said longitudinal axis and to a direction of the			
3		static r	nagnetic field in said sensitive volume.			
4						
1	29.	(origin	al) The method of claim 23 wherein the at least one receiver coil further			
2		compri	ises at least two receiver coils offset along the longitudinal axis.			
3						
4	30.	(origin	al) The method of claim 23 further comprising using a field shifting			
5		electro	magnet including a coil for adjusting a position of the sensitive region in			

6		the formation.
7	•	
1	31.	(original) The method of claim 23 wherein the transmitter coil has a greater length
2		along the longitudinal axis than the at least one receiver coil, the method further
3		comprising moving the logging tool along the longitudinal axis while making
4		continuing measurements.
5		
1	32.	(original) The method of claim 23 further comprising adjusting a gap between
2		ends of the first and second magnet away from the yoke and adjusting a position
3		of the sensitive region.
4		
1	33.	(currently amended) The method of claim 23 further comprising using a processor
2		for determining from the spin-echo signals from the at least one receiver coil the
3	•	parameter of interest of the earth formation.
4		
1	34.	(currently amended) The method of claim 29 further comprising using a processor
2		for determining from the spin echo signals from the at least two receiver coils the
3		parameter of interest of the earth formation.
4		•
1	35.	(original) The method of claim 23 wherein the parameter of interest comprises at
2		least one of (i) clay bound water, and, (ii) bulk volume irreducible.

3	
1	

1 36. (original) The method of claim 24 wherein the plurality of sensor assemblies
2 comprises three, and wherein the parameter of interest comprises bound volume
3 irreducible, the method further comprising determining a dip and azimuthal
4 direction of the formation.

37. (currently amended) The method of claim 24 wherein the plurality of sensor assemblies comprises three, and wherein the parameter of interest comprises clay bound water, the method further comprising determining a dip an azimuthal orientation and azimuthal orientation of shale laminations.

38. (original) The method of claim 24 wherein the plurality of sensor assemblies comprises three and wherein the parameter of interest comprises clay bound water and bulk volume irreducible, the method further comprising determining dip and cross-bedding of the formation.

1 39. (original) The method of claim 30 further comprising repeating steps (a) - (c) for a
2 different positions of the sensitive region using a phase alternated pulse sequence.

40. (original) The method of claim 35 wherein producing said pulsed RF magnetic field further comprises modulating a RF signal with a modulating signal that is

4

1 44. (original) The method of claim 42 wherein said RF magnetic field has a field
2 direction substantially orthogonal to said longitudinal axis and to a direction of the
3 static magnetic field in said sensitive volume.

4

1 45. (original) The method of claim 42 wherein the at least one receiver coil further
comprises at least two receiver coils offset along a direction substantially
perpendicular to a direction of the static magnetic field in the sensitive region.

4

1 46. (original) The method of claim 42 further comprising using a field shifting
2 electromagnet including a coil for adjusting a position of the sensitive region in
3 the formation.

4

(original) The method of claim 42 further comprising adjusting a gap between
 ends of the first and second magnet away from the yoke and adjusting a position
 of the sensitive region.

8

1 48. (currently amended) The method of claim 42 further comprising using a processor
2 for determining from the spin echo signals from the at least one receiver coil the
3 parameter of interest of the earth formation.

4

1	49.	(original) The method of claim 46 further comprising repeating steps (a) - (c) for a
2		different position of the sensitive region using a phase alternated pulse sequence.

2		
	51.	canceled
1	52.	(new) The logging tool of claim 7 wherein said at least one sensor assembly is
2		adapted to be rotated to a position wherein said at least two receiver coils are at
3		substantially the same longitudinal position
4		·
1	53.	(new) The method of claim 29 further comprising:
2		(i) rotating said sensor assembly to position said at least two receiver coils at
3		substantially the same longitudinal position; and
4		(ii) obtaining said signals with an increased azimuthal resolution.
5		
1	54.	(new) The logging tool of claim 1 wherein said magnet has a higher magnetization
2		at an end than at a middle portion of said magnet.
3
